

With your consultants, directors, and employees mostly traveling you may be paying those with roaming charges as well. Internet sources like WIFI and Ethernet Cables are often provided but the security policy advises not to use them as they're insecure. The R1 enables them to connect through those insecure networks in a secure fashion. Even if they still use cellular data through the R1, it will save up to 30% of data used browsing the same websites, by filtering out background data and advertisements.

**CELLULAR DATA IS THE MOST
EXPENSIVE INTERNET SOURCE**

Employees usually have their own. Bring Your Own Device or BYOD is a trend where employees use their own devices and potentially save the organization a huge amount of resources. With a travel router like the R1, the corp still owns all the data flowing through it. It can also be used to unlock certain work-related directories and files on their devices. So they only get to access it when they connect through the R1, at that point your technology department is able to monitor, interact, and support if needed, just like your own business devices.

C O R P O R A T E D E V I C E S A R E

EXPENSIVE.

Short term savings is what you want.
Long-term savings and process optimization are what
you need.
You get both.
